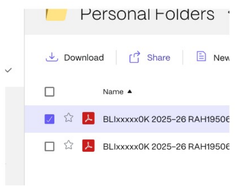
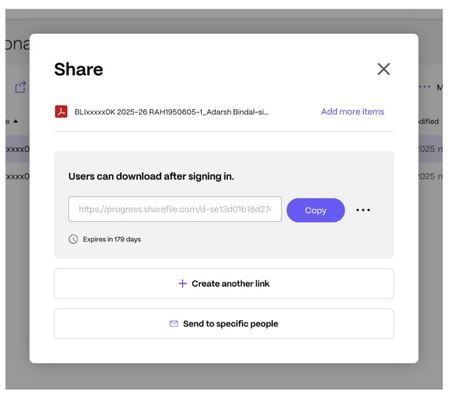
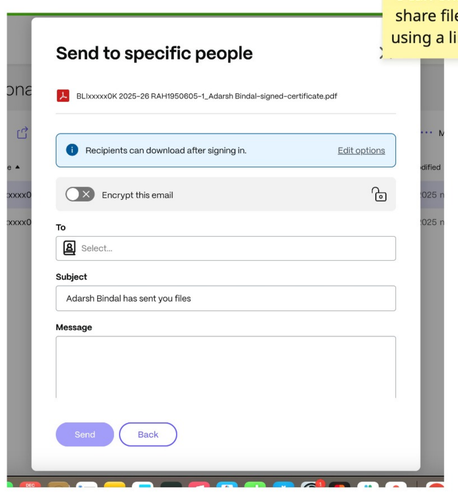
Current state in Sharefile

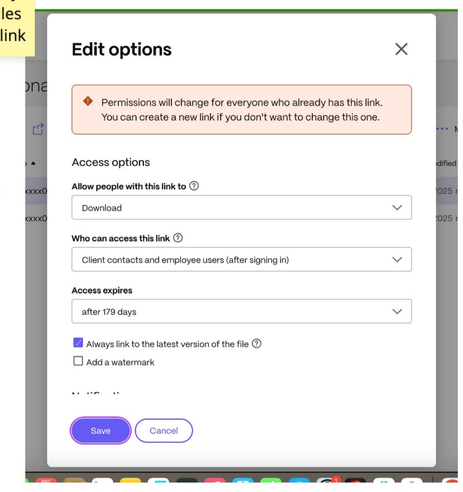
As a worker, I want to **share files** with my **team or client** so that I can collaborate with them.



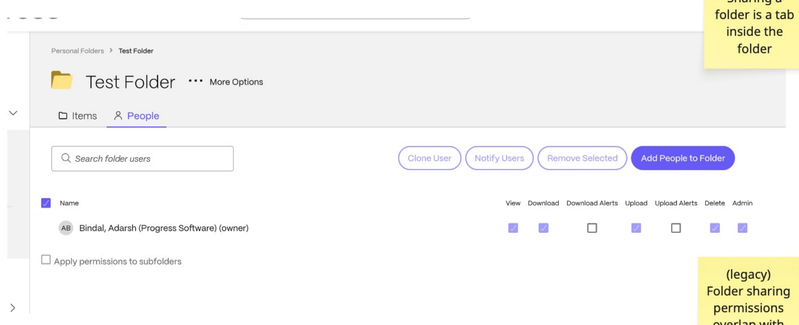


(legacy)
I can only share files using a link

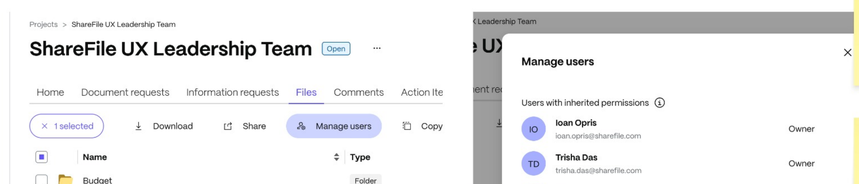


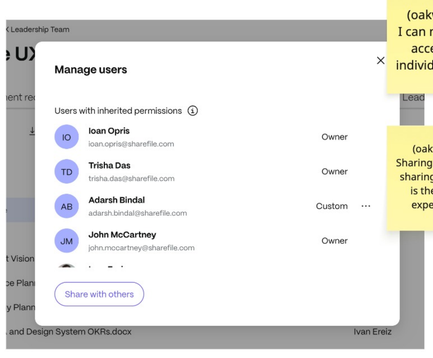


(legacy)
Sharing a folder is a tab inside the folder



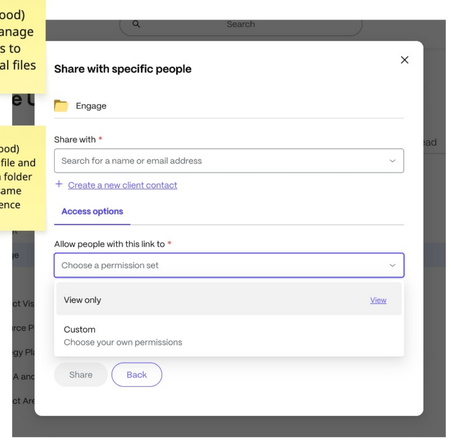
(legacy)
Folder sharing permissions overlap with alerts

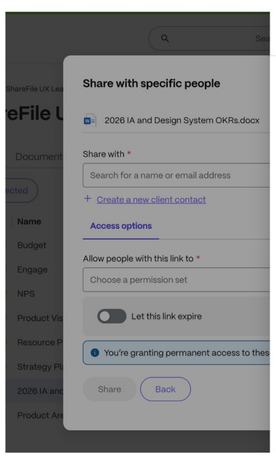


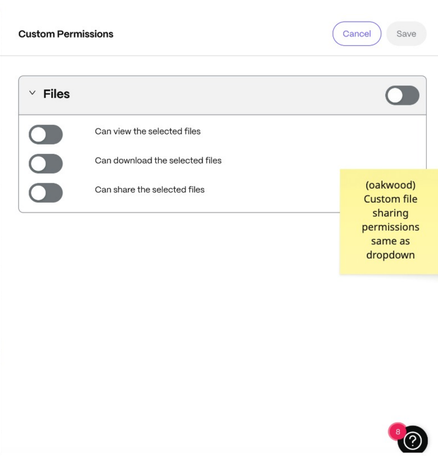


(oakwood)
I can manage access to individual files

(oakwood)
Sharing a file and sharing a folder is the same experience

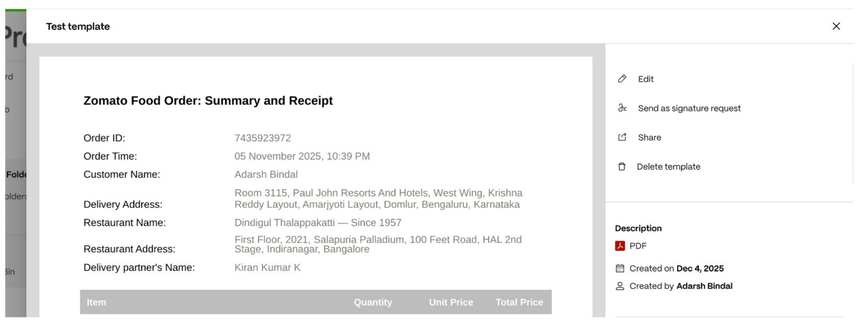


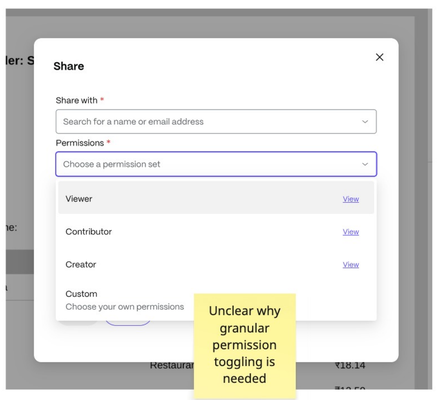




(oakwood)
Custom file sharing permissions same as dropdown

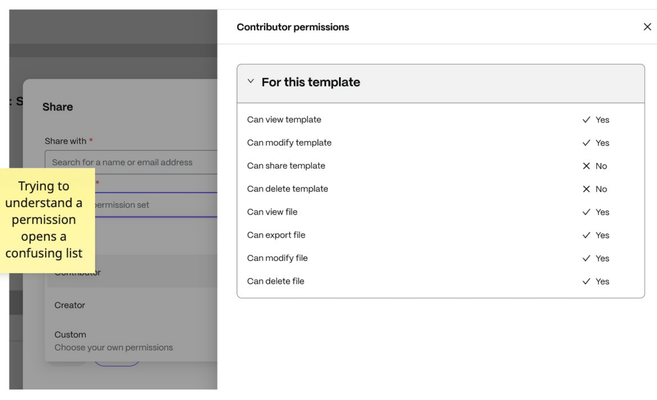
As a worker, I want to **share templates** with my **team** so that I can ensure consistency in my team's work.



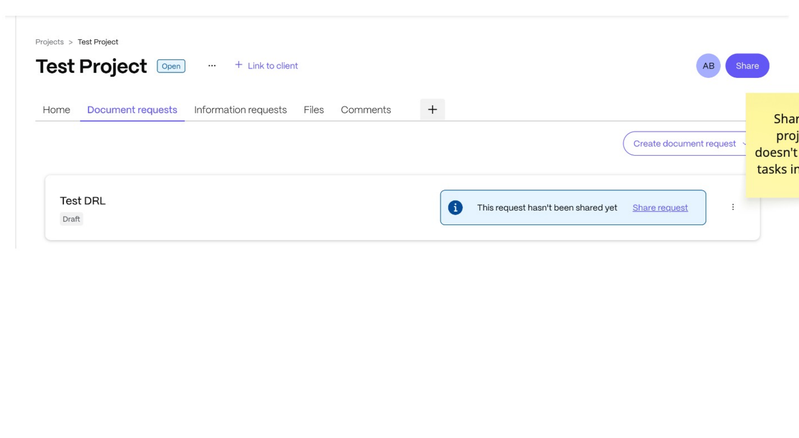


Unclear why granular permission toggling is needed

Trying to understand a permission opens a confusing list



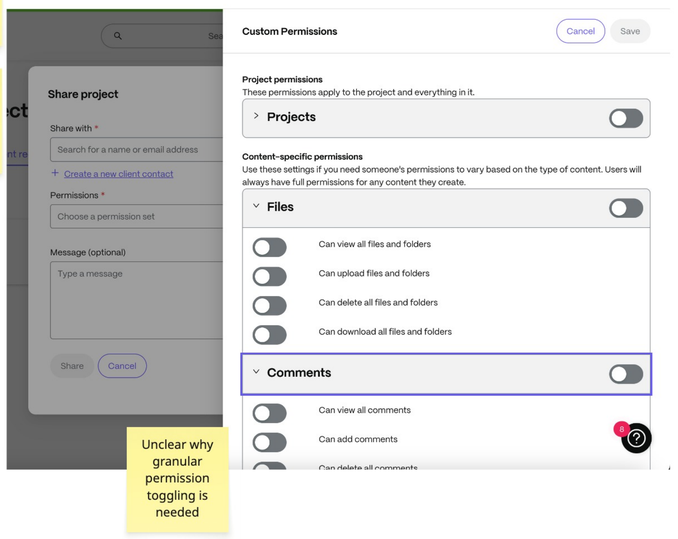
As a worker, I want to **add collaborators on a project** so that I can delegate work to my **team**.



Sharing project doesn't assign tasks inside it

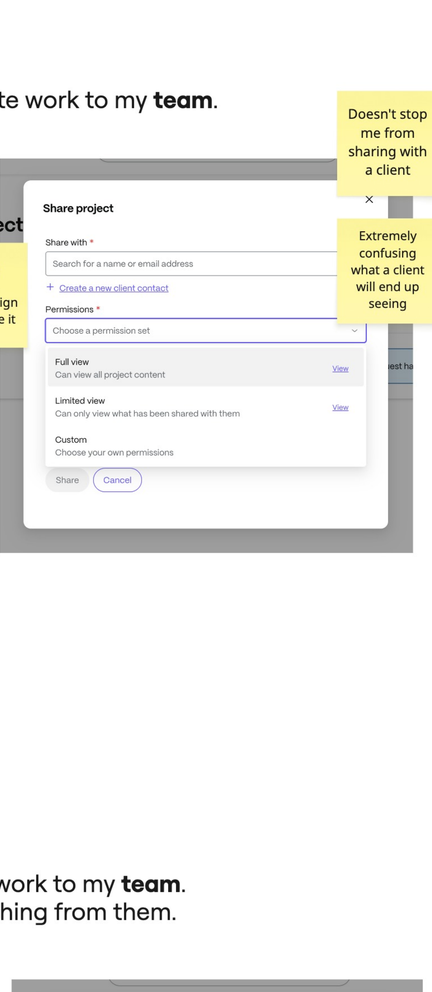
Doesn't stop me from sharing with a client

Extremely confusing what a client will end up seeing



Unclear why granular permission toggling is needed

As a worker, I want to **add collaborators on a task** so that I can delegate work to my **team**.
As a worker, I want to **assign a task** to a **client** so that I can receive something from them.



Sharing with client and team member is from the same modal

Doesn't translate to permissions on the project

Doesn't stop me from assigning to different clients in the same project

Doesn't stop me from adding team member as assignee or client as a totally custom permission set

Unclear why granular permission toggling is needed

Doesn't exist

As a worker, I want to **add collaborators on a data-table** so that I can delegate work to my **team**.

As a worker, I want to **assign a to-do task** to a **team member** so that I can track delegated work.
